

VALVES

LINE CLEANING VALVES

VPC Series: Line cleaning valves provide effective purging of residue material in conveying lines between conveying cycles.

Controlled by a signal from the loading system, the valve allows air to flow through the conveying line for a set time to clear any residue material.

Typical Use: Undried or raw material conveying lines.

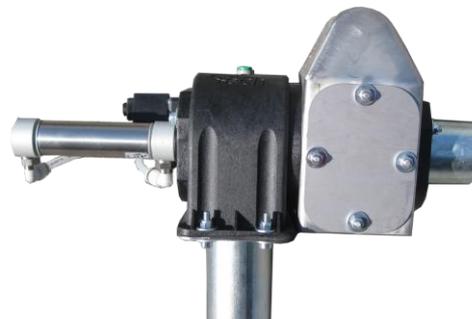

VPCIM Series: Line cleaning valve for purging residue material in closed circuit conveying lines between conveying cycles.

Typical Use: Material conveying with dehumidified air or vacuum pump re-circulation.

While vacuum is still present the valve closes the material line, the flow of air continues through the valve to fully purge residue material from valve and conveying line.
