

COLLECTING CHUTE - ARB

The collecting chute ARB is mounted on the clamping plates and the installed funnel of an injection moulding machine via strong permanent magnets. It safely collects the moulded parts after demoulding and transfers them into the installed funnel of the machine. The chute flexes to move with the tool. This chute closes the gap between the tool and the installed funnel of the machine.

PRODUCT FEATURES

- Aluminium profiles as holder
- Attached on the clamping plates and the installed funnel of the machine
- Extra flat and space-saving construction
- Different materials available, depending on the application
