

COLLECTING FUNNEL ATB-DS

The collecting funnel ATB-DS with two diagonal runouts is mounted under the tool of an injection moulding machine via strong permanent magnets. It safely collects and separates the moulded parts after demoulding and transfers them onto conveyor belts or into containers next to the machine. The fabric funnel flexes to move with the tool. Optional attachments such as soft drop baffle and/or removable base ensures damage free collection and waste reduction of the moulded parts.

PRODUCT FEATURES

- Aluminium profiles as holder
- Attached to the tool, the clamping plates or in the machine bed
- Two diagonal run-out chutes for transferring moulded parts onto conveyor belts or into containers next to the machine
- Options: bafflers, removeable base
- Separates sprue and parts while falling
- Different materials are available depending on the application
