

COLLECTING FUNNEL ATF-D

The collecting funnel ATF-D with two straight runouts is mounted in the machine bed of an injection moulding machine via strong permanent magnets. It safely collects the moulded parts after demoulding and transfers them onto conveyor belts or into containers under the machine. The funnel has a fixed frame. Through the two runouts, parts can directly be separated from sprue while falling.

PRODUCT FEATURES

- Fixed frame of aluminium profiles
- Attached in the machine bed
- Two run-out chutes for transferring moulded parts onto conveyor belts or into containers under the machine
- Separates sprue and parts while falling
- Options: distances or brackets
- Different materials are available depending on the application
